CI Transfer

Fast, browser-based data transfer, in-browser review, and end-to-end verification for modern eDiscovery

Streamlined intake for eDiscovery teams, law firms, and corporate legal departments

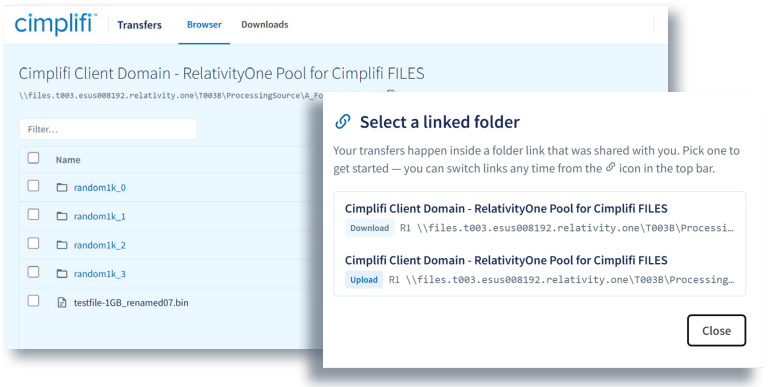

CI Transfer helps clients and case teams move data directly to the right destination through a simple browser-based workflow. Built for legal data movement, it combines high-speed transfer, resume/retry, multi-folder upload, SHA-256 verification, and robust audit logging, and built-in Viewer capabilities that let teams inspect files before they send or load them.

CLIENT-FRIENDLY BY DESIGN

Clients can upload files or folders through a clean browser workflow, including drag-and-drop and multi-folder selection. No software installations, firewall changes, or IT support tickets are required.

FEWER HANDOFFS

Data moves directly to the chosen destination, reducing duplicate copies, unnecessary staging locations, and manual downloads/re-upload steps.

BUILT-IN DEFENSIBILITY

Every file is hashed during transfer using SHA-256, helping receiving parties confirm byte-for-byte integrity for forensic and chain-of-custody requirements.

CONTINUITY FOR LARGE TRANSFERS

Resume and retry capabilities allow interrupted transfers to pick up where they left off, supporting long-running jobs.

FLEXIBLE FILE & FOLDER SELECTION

Browse, drag-and-drop, add or remove individual files from a batch before submission. Transfer entire folder structures with ease.

SEE WHAT YOU'RE SENDING OR RECEIVING

Viewer lets case teams inspect files directly in CI Transfer before they send or load them, helping identify issues earlier without downloading another copy.

Ideal Use Cases

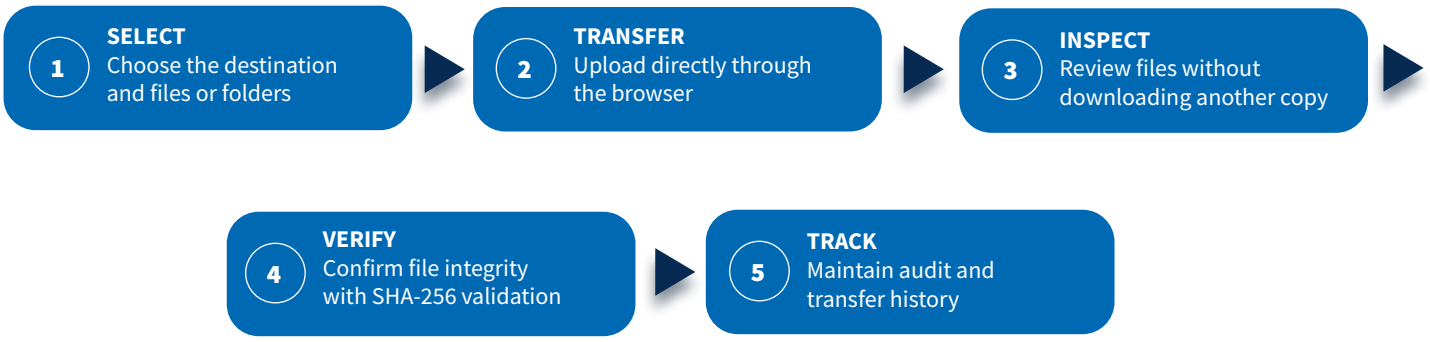

→ **Corporate Legal Teams** Securely submit large matter data sets directly to your desired location or outside counsel, without IT-heavy setup or custom tooling.

→ **Law Firms** Give corporate clients and custodians a controlled upload path so data arrives where it needs to be, with a full audit trail.

→ **Case Teams** Monitor incoming transfers, verify integrity on receipt, and maintain chain-of-custody documentation from one dashboard.

A simpler way to move legal data

CI Transfer removes friction from a critical intake step: getting data into the right environment with speed, security, and confidence in file integrity.

What clients gain

SPEED & CONTROL

- High-speed, multi-threaded uploads designed for enterprise-grade performance from the browser.
- Support for large files, large folders, and mixed file sets.
- Ability to add or remove files before submission.
- SHA-256 verification runs concurrently with upload to accelerate transfer workflows.
- Preview files directly in the browser without downloading or creating another local copy.
- Review production files before they are sent or loaded, helping teams identify issues earlier.

CONFIDENCE & TRANSPARENCY

- End-to-end validation using SHA-256 hash values.
- Exportable audit logs capturing transfer details, timing, user activity, and verification information.
- Historical transfer records remain available for future review, helping teams verify what was transferred, by whom, and when.
- Preview ZIP contents and generate inventory reports to understand what was received before determining the next step.

Purpose-built for legal data movement

CI Transfer brings data transfer into a legal-industry workflow — easy for clients to use, practical for case teams to manage, and grounded in the verification and auditability eDiscovery requires.

- Clients looking for a simple, direct upload experience.
- Matters involving large files, many folders, or interrupted uploads.
- Teams that need clear transfer records and defensible validation.

CI Transfer gives clients a direct, browser-based way to upload data while giving case teams the speed, visibility, and integrity checks needed to manage transfers with confidence.
